Payvyn

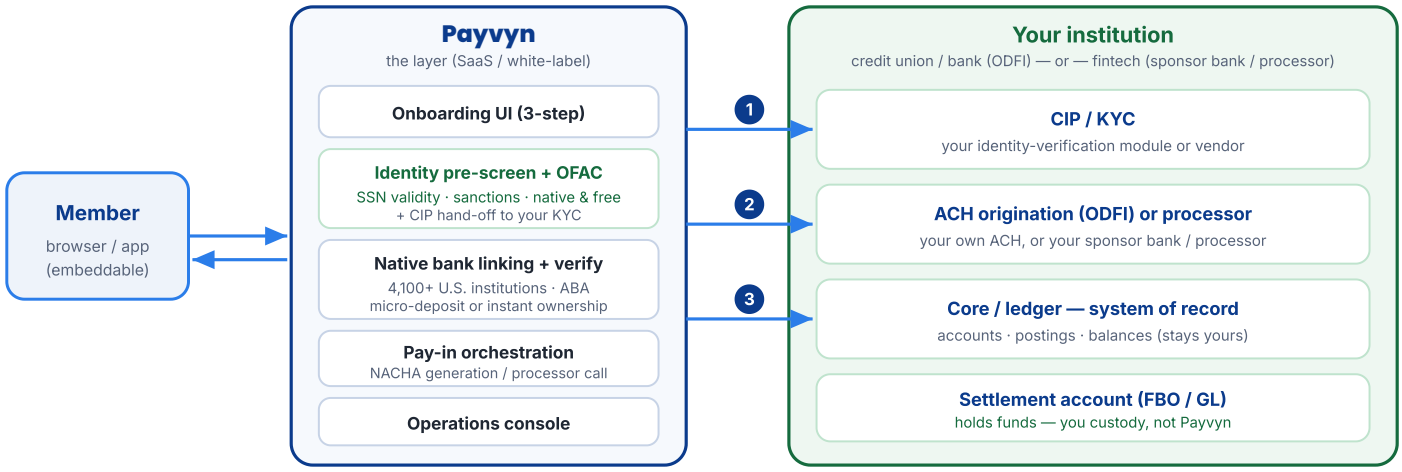

Platform Architecture

A native onboarding, verification & pay-in layer any credit union or fintech can adopt

Payvyn is a drop-in layer that sits in front of your institution. It handles member onboarding, identity & bank verification, and the pay-in — then hands verified members and funded transactions to **your** systems. It rides **your own rails** (your ACH or processor, your CIP, your core or ledger) with no aggregator, and it is modular: adopt the pieces you need.

Payvyn does not access your core — and never holds funds.
Payvyn plugs in **in front of** your institution. It **never connects to, reads from, or writes to your core or ledger**, and it is **non-custodial** — funds settle only to **your** (or your sponsor bank's) account. Every interaction is a **hand-off**: Payvyn passes you verified members and ready-to-process files/records; you remain the system of record and the custodian.

1 Architecture at a glance

1 Identity (CIP hand-off) · 2 Bank verify + pay-in (your ACH / processor) · 3 Core / ledger (verified members + funded transactions)

Payvyn runs the free native checks, then hands off to your systems over your own rails. You keep the core, the system of record, and custody of funds.

2 What Payvyn provides (modular — adopt what you need)

Onboarding UI
Embeddable / white-label 3-step flow (identity → bank → fund).

Identity pre-screen FREE
SSN/ITIN validity + known-invalid rejection; age/name/address checks.

OFAC screening FREE
Every applicant screened against the live public sanctions lists.

CIP hand-off
Submit the pre-screened applicant to your KYC for the identity match.

Native bank linking
4,100+ U.S. institutions, ABA validation, ownership verification — no aggregator.

Pay-in orchestration
Generates NACHA for your ACH, or calls your processor; returns handling + reconcile.

3 How it integrates

Integration	What connects	Direction	You provide
1. Identity (CIP)	Pre-screened applicant → your CIP/KYC → decision	hand-off	CIP endpoint (API/SFTP) + result format
2. Bank verify + pay-in	Ownership check + funding over your ACH (NACHA) or processor	hand-off + returns	ACH origination details, or processor keys; settlement account

3. Core / ledger	Verified members + funded transactions → your core/ledger	hand-off	new-account + posting file, or core API
Status / returns	Postings, ACH returns (R-codes) → Payvyn reconciles	back to Payvyn	return file / status feed

4 Works for either kind of adopter

Function	Credit union / bank (is an ODFI)	Fintech (non-bank)
Pay-in rail	Your own ACH origination (Same-Day)	Your sponsor bank / processor (ACH, pay-by-bank)
Identity / CIP	Your core CIP module or KYC vendor	Your KYC vendor
System of record	Your core banking platform	Your ledger
Settlement / custody	Your FBO / GL account	Your sponsor bank's FBO account
Payvyn's role	Onboard · pre-screen (free) · verify the bank · prepare the pay-in · hand off — **never custodies funds or touches your core**	

Same platform, either way. Payvyn is a thin layer on top of whatever you already run — your rails, your vendors, your system of record. Nothing about Payvyn requires you to change cores, switch processors, or adopt an aggregator.

5 Adoption models — start least-privilege

A. File-based RECOMMENDED START

- **Zero core access.** Secure file exchange (SFTP): applicant → CIP; NACHA → ACH; a posting/settlement file → you post.
- You stay the only party that writes to the core.
- Fastest to approve — minimal security review, no API project.

B. API-integrated PHASE 2

- Direct, real-time calls to your core/ledger & processor APIs.
- Scoped client limited to named operations — never open or standing access.
- Smoother member experience (instant open + post).

6 Security & posture

- **No core access** — Payvyn hands off; you remain the system of record and the only writer to your core.
- **Non-custodial** — funds settle only to your (or your sponsor bank's) account; Payvyn never holds funds.
- **Scoped credentials** per integration (CIP, ACH/processor, optional core API) — no standing admin access.
- **Data protection** — SSN/account numbers encrypted in transit & at rest; full numbers stay server-side, never in the browser.
- **Native & free baseline** — SSN validity + OFAC screening run at $0, before anything reaches your paid systems.
- **Audit** — every hand-off, origination, and return is logged and reconciled.
