Payvyn

Payments Enabled Growth

Executive Summary

Digital Onboarding & Payments for Credit Unions · Oct 2026

Payvyn is a native digital onboarding and payments platform, built by BizFormCorp, that lets a credit union acquire a member online, verify their identity, link and verify any U.S. bank account, capture authorization, and move funds into the member's account — by ACH or FedNow. It is a single, extensible foundation — not siloed tools, and **not dependent on any third-party account-linking aggregator**. The platform and its native bank-ownership verification are **built and deployed today**.

What Payvyn does

1 · Identity & Verification

Capture member information and verify identity for compliant CIP/KYC onboarding, with automatic address population.

2 · Native Bank Linking + Ownership

Link any of 4,100+ U.S. institutions; verify account ownership natively via micro-deposits over the CU's own ACH — no aggregator.

3 · Account Funding

Authorized ACH debit into the member's credit-union account, with FedNow for eligible instant settlement.

4 · Core-Integrated Operations

Account crediting, transaction tracking, reconciliation, fraud monitoring, and reporting through the core's connectors.

Value to the credit union

- **Digital member acquisition** — onboard & fund new members fully online.
- **Deposit & funding growth** — frictionless external-to-CU account funding.
- **New fee & transfer revenue** — a launchpad for additional products.
- **No aggregator dependency or per-link fees** — Payvyn owns the stack.
- **Fast, low-risk deployment** — layers onto the existing core, no rip-and-replace.
- **The CU stays in control** — regulated institution & system of record.

What's live today

• **Platform** — a secure, installable web app at **https://payvyn.org**: member onboarding, native bank linking across **4,100+ U.S. institutions**, the ACH/FedNow funding flow, and the Core operations console (tracking, reconciliation, fraud, reporting).

• **Native ownership verification — deployed & tested** — a live backend that verifies external-account ownership by micro-deposits over the credit union's **own ACH** (no third party), with server-side, attempt-limited security. Running in sandbox and verified end to end.

Installable PWA · Core Console at /#console (passcode payvyn2026) · "+ Demo data" to populate

Readiness for integration

Payvyn is ready to integrate. The member-facing layer (identity capture, bank linking, ownership verification) and the verification backend are **built and deployed**. Going live for real money movement is a **configuration-and-integration effort** — connecting the credit union's ACH origination and core — **not a ground-up build**. Where identity, bank-linking, and

> funding are shown as simulated in the live demo, each is swapped for the real rail during integration; the native ownership-verification rail is already real and deployed.

What the credit union provides to go live

- **ACH origination (ODFI)** + **Same-Day ACH**
- Company ID / routing / settlement account
- Core-system integration access (Symitar/Episys, KeyStone, Fiserv, FIS)
- **BSA/AML program** ownership + Regulation E
- Identity-verification method (the CU's CIP or a provider)
- Examiner notification / NCUA non-objection, per policy

Next steps

1. Live walkthrough of Payvyn (platform + the deployed ownership verification).
2. Discovery — confirm the core system and ACH origination details.
3. Statement of Work — phased integration, timeline, and fees (see the full proposal).
