Payvyn
Payments Enabled Growth

PLATFORM PROPOSAL

Integrated Digital Onboarding & Payments Platform

Payvyn is a native, end-to-end platform — built in-house by BizFormCorp — that onboards and verifies customers, links any U.S. bank or credit union, and funds credit-union accounts by ACH and FedNow.

PREPARED FOR	PREPARED BY	PLATFORM	DATE
The Credit Union	BizFormCorp	Payvyn (native build)	October 2026

Confidential — prepared for the named recipient for evaluation purposes. This proposal is informational and does not constitute legal, tax, or regulatory advice.

1 Executive Summary

Payvyn is a native digital onboarding and payments platform, built and owned by BizFormCorp, that enables the credit union to identify customers, verify their identities, securely link external bank accounts, obtain payment authorization, and move funds into credit-union accounts by ACH or FedNow.

The platform is already built and operational. We propose to configure and integrate Payvyn with the credit union's core so it can power digital customer acquisition, account funding, and additional digital services over time. Because Payvyn is a single, extensible foundation — not a set of siloed tools, and not dependent on any third-party account-linking aggregator — new services can be added as the credit union grows without rebuilding the underlying infrastructure.

Built, deployed & demonstrable today. Payvyn is live as a secure, installable web app at **payvyn.org** — member onboarding, native bank linking across 4,100+ U.S. institutions, the ACH/FedNow funding flow, and the operations console. Its **native bank-ownership verification is already deployed as a live backend** (micro-deposits over the credit union's own ACH, no third party) and verified end to end with server-side, attempt-limited security.

2 Platform Capabilities

Payvyn delivers four integrated capabilities, all developed natively:

2.1 Customer Identification and Verification

- Digitally capture customer information, with automatic address population.
- Verify customer identity for compliant CIP/KYC onboarding, including document and selfie capture and OFAC/sanctions screening.
- Create and retain the compliance record that supports onboarding requirements.

2.2 Native External Bank Account Linking

- Link **any of 4,100+ U.S. banks and credit unions** through Payvyn's built-in institution directory — **no third-party aggregator**.
- Verify the account natively: **ABA routing-number validation** plus **instant or micro-deposit** ownership verification.
- Capture and timestamp the required customer consent and authorization before any debit.

2.3 Electronic Account Funding

- Initiate authorized transfers from the linked external account into the credit-union account.
- **ACH debit** for authorized withdrawals, with return handling and pre-funding risk screening.
- **FedNow** for eligible instant settlement where the originating and receiving institutions participate.

2.4 Integrated Core Operations

- Connect to the credit union's core banking system **through its existing, supported integration layer** — alongside the core, with no rip-and-replace.
- Account crediting, transaction tracking, reconciliation, fraud monitoring, and operational reporting (the Payvyn operations console).
- An extensible architecture for additional digital financial products.

Easy, low-risk core integration — by design. Payvyn connects to the credit union's core through **standards-based interfaces** (the core vendor's APIs/connector program, NACHA ACH files, and ISO 20022 messaging), so it **layers onto the existing core rather than replacing it**. It is compatible with the major core platforms (for example Jack Henry Symitar/Episys, Corelation KeyStone, Fiserv, and FIS), uses **vendor-certified connectors** where available, and is validated in a **sandbox / UAT environment** before a phased go-live — keeping the credit union's IT lift and operational risk to a minimum.

3 Important Payment Infrastructure Consideration

FedNow is an instant payment service, but it does not itself link external bank accounts or authorize the credit union to debit them.

> **Starting point:** For customers who want to authorize the credit union to pull money from an external bank account, **ACH debit** is generally the appropriate mechanism. FedNow can *complement* this by supporting eligible instant payments initiated through participating institutions. Its **Request for Payment** feature can facilitate payment requests, but the request itself does not move funds — the payment must still be authorized and initiated appropriately.

Accordingly, Payvyn leads with **ACH debit for authorized account funding** and layers in **FedNow instant settlement** where participation and arrangements allow — giving the credit union a compliant foundation today and an upgrade path to real-time payments.

4 Deployment & Integration Approach

Because Payvyn is already built, deployment is a configuration-and-integration effort rather than a ground-up build. It is phased so the credit union gains value early and each layer is validated before the next is added.

1 Identity	**Configure onboarding & identity verification.** Stand up digital information capture, identity verification, and the compliance (CIP/KYC) data flows for new-customer onboarding.
2 Linking	**Enable native bank linking & consent.** Turn on Payvyn's built-in institution directory and ABA/ownership verification, with auditable consent & authorization capture.
3 Funding	**Activate ACH debit account funding.** Authorized ACH debits from linked external accounts into credit-union accounts, with return handling and risk screening.
4 Core	**Integrate with the core.** Connect through the core's supported APIs/connectors (vendor-certified where available), validated in sandbox/UAT, then phased into production — delivering account crediting, reconciliation, fraud monitoring, and reporting with minimal IT lift and no core replacement.
5 Instant & expand	**FedNow & new products.** Add eligible instant settlement via FedNow, then extend the shared platform to additional digital products and services as the credit union grows.

5 Platform Components & Connectivity

Payvyn is a native build — its onboarding, bank-linking, funding, and operations logic is developed and owned by BizFormCorp, not rented from an aggregator. The platform connects to the following external systems and payment rails:

Capability	How Payvyn delivers it
Identity & KYC	Native onboarding and verification module (information capture, document/selfie, OFAC screening); optional external data checks for enhanced verification
Bank-account linking	**Native** — built-in U.S. institution directory (4,100+), ABA validation, instant / micro-deposit ownership verification. No aggregator
ACH debit origination	Via the credit union's ACH origination rails / arrangements

Instant payments	FedNow via the core / a participating institution
Core banking	Standards-based connectors to the credit union's core (Symitar/Episys, KeyStone, Fiserv, FIS)
Risk & fraud	Native pre-funding checks, return-risk screening, and transaction monitoring in the operations console

6 Security, Compliance & Governance

Security & data

- Encryption in transit and at rest
- **No bank logins or stored banking credentials** — accounts are linked by routing/account with ownership verification
- Least-privilege access & audit logging
- GLBA Safeguards-aligned controls

Compliance

- CIP / KYC and BSA/AML + OFAC screening
- Consent & authorization records for each transfer
- NACHA rules for ACH; Regulation E protections
- Reconciliation & reporting for examinations

Governance & roles. The **credit union** remains the regulated financial institution and system of record — it holds the accounts and owns the BSA/AML program and regulatory relationships. **BizFormCorp** is the developer and operator of the Payvyn platform, delivering and supporting it under the credit union's oversight.

7 Value to the Credit Union

- **Grow membership & deposits** — onboard and fund new members fully online; frictionless external-to-CU account funding brings balances in from day one.
- **New non-interest revenue** — a launchpad for funding and transfer products, and the fee income they carry.
- **No aggregator dependency or per-link fees** — Payvyn owns the onboarding, linking, and verification stack; the credit union isn't paying an aggregator per connection.
- **Fast, low-risk deployment** — the platform and the verification backend are already built and deployed; connecting the CU is configuration and integration, not a ground-up build, and it layers onto the existing core with no rip-and-replace.
- **The credit union stays in control** — it remains the regulated institution and system of record, owning the member relationship, the accounts, and the BSA/AML program.
- **Future-ready payments** — ACH today with a clean upgrade path to FedNow instant settlement, on one extensible foundation.

8 Indicative Timeline

Phase	Scope	Indicative duration
Discovery & design	Requirements, core-integration scope, architecture, SOW	2–4 weeks
Phase 1–2	Onboarding/identity + native bank linking & consent	3–6 weeks
Phase 3–4	ACH funding + core integration, reconciliation, reporting	5–9 weeks
Phase 5	FedNow & new-product expansion	Scheduled after core go-live

Durations are shorter than a ground-up build because the platform already exists; they overlap where dependencies allow and are confirmed in the Statement of Work.

9 Investment & Engagement

Payvyn is BizFormCorp's platform; the engagement covers its configuration, core integration, and ongoing operation for the credit union, structured in phases with defined deliverables and acceptance criteria. A detailed **Statement of Work and fee schedule** is provided following the discovery session, once core-integration scope is confirmed.

Component	Basis	Investment
Discovery & design	Fixed	[to be finalized]
Platform configuration & core integration (Phases 1–4)	Fixed, by phase	[to be finalized]
FedNow & new-product expansion (Phase 5)	Scoped separately	[to be finalized]
Ongoing platform license, support & maintenance	Monthly / retainer	[to be finalized]

External fees (ACH/FedNow network access, core-integration, and any optional identity data checks) are contracted directly by the credit union.

10 What the Credit Union Provides to Go Live

Because Payvyn and its verification backend are already built and deployed, going live is a configuration-and-integration effort. The credit union provides:

Area	What's needed
ACH origination (ODFI)	The CU originates ACH (most already do), with **Same-Day ACH** enabled so verification micro-deposits and funding settle the same business day.
ACH configuration	Company Identification & Name, originating / immediate routing numbers, and the settlement (GL) account entries settle against. SEC code PPD (consumer).
Core integration access	API/connector credentials + a sandbox for the core (Symitar/Episys, KeyStone, Fiserv, FIS) to post credits, reconcile, and report.
Identity / KYC	The CU's existing CIP program, or selection of an identity-verification provider to plug in.
Compliance ownership	BSA/AML program, OFAC screening, and Regulation E as the regulated institution; examiner pre-notification / NCUA non-objection per policy.
Return handling	Process ACH returns (R-codes) so failed verifications and funding resolve cleanly.

> **Go-live sequence:** (1) connect the CU's ACH origination & flip Payvyn's verification to production → (2) wire the core connector for crediting & reconciliation → (3) enable the identity & funding rails → (4) pilot with limits, then scale → (5) add FedNow where eligible.

11 Next Steps

1. Live demonstration of the Payvyn platform.
2. Discovery session to confirm requirements and core-integration scope.
3. Statement of Work with finalized phases, timeline, and fees.
4. Execution of agreement and project kickoff.

Acceptance

Accepted on behalf of the parties as the basis for proceeding to a Statement of Work.

The Credit Union — Authorized Signature & Date

BizFormCorp — Authorized Signature & Date

This proposal is provided for evaluation and planning purposes. Specific integrations, timelines, and fees are finalized in a Statement of Work. Payment-rail capabilities (ACH, FedNow, Request for Payment) are described generally and depend on the credit union's core system, origination arrangements, and participation; implementation is subject to applicable NACHA, Federal Reserve, and regulatory requirements. Nothing herein constitutes legal, tax, or regulatory advice.
