Payvyn

Project Task Sheet

Inception to date · status, capabilities & capacity · Oct 2026

Payvyn (by BizFormCorp) is a native digital onboarding & payments platform for credit unions — member onboarding, identity verification, native bank linking + ownership verification, ACH/FedNow funding, and a core-integrated operations console. This sheet logs every task from inception, its status, the current capabilities, and system capacity.

LIVE in production · DEPLOYED running backend · DONE built/completed · SIMULATED demo until integrated · PENDING for production

1 Platform — the web application

Task	Purpose	Status
Interactive platform built	End-to-end prototype: Overview, Open & Fund Account, Core Console (self-contained HTML).	LIVE
3-step onboarding wizard	Identity → bank link → authorize & fund, with progress steps.	LIVE
Identity capture + ID/selfie upload	Member info, SSN/ITIN, address, document capture; CIP/KYC result.	SIMULATED
Account funding flow	Amount, ACH vs FedNow choice, timestamped authorization consent.	SIMULATED
Core Console	KPIs, transactions ledger w/ status control, customers, reconciliation, fraud monitoring, reports, CSV export, demo-data seeder.	LIVE
Console moved off public nav	Removed from the public site; reachable at a direct link (/#console), passcode-gated.	DONE

2 Native bank linking & ownership verification

Task	Purpose	Status
US institution directory	All **4,143 active FDIC banks** + major credit unions (from the FDIC BankFind API), searchable type-ahead.	LIVE
ABA routing validation	Real 9-digit checksum + recognition of major banks; any valid routing accepted.	LIVE
Automatic address population	Live address autocomplete (OpenStreetMap, no key) + browser autofill.	LIVE
Native verification backend	Cloudflare Worker: micro-deposit ownership verification over the CU's **own ACH** — no third-party aggregator. Tested end to end.	DEPLOYED
NACHA ACH-file generator	Produces the standard 94-char NACHA file the CU originates to send the micro-deposits.	DONE
KV-backed attempt limiting	Server-side state, 3 attempts then locked (brute-force protection). Verified.	DEPLOYED
Secret hardening	Encryption secret stored as a Cloudflare secret, not plaintext config.	DEPLOYED
Wired into onboarding	The "confirm the amounts" step calls the live backend (sandbox), with a safe demo fallback.	LIVE

3 Brand, hosting, domain & app

Task	Purpose	Status
Renamed CoreBridge → Payvyn	Brand chosen; repo, folder, domain, and all documents updated.	DONE

Logo + favicon	Cropped mark from the supplied artwork + "Payvyn" wordmark + "Payments Enabled Growth"; browser-tab favicon.	LIVE
GitHub Pages deployment	Repo Nubridgemd1/payvyn, auto-deploys on push.	LIVE
Custom domain + HTTPS	payvyn.org registered, DNS pointed, TLS certificate issued, **Enforce HTTPS ON**.	LIVE
Installable PWA	Manifest + service worker + install prompt; offline app-shell; home-screen install.	LIVE
Mobile layout + prototype banner	Responsive header/nav fixes verified (no horizontal overflow); prototype banner removed.	DONE
Backend claimed + deployed	Cloudflare Worker + KV live under the account; secret set; same URL wired to Payvyn.	DEPLOYED

4 Documents & go-to-market

Task	Purpose	Status
Platform Proposal (credit union)	Full proposal: capabilities, deployment approach, value, what the CU provides to go live + go-live sequence.	DONE
Executive Summary	One-page shareable: features, value, what's live, readiness for integration.	DONE
Competitive Landscape & Projection	Positioning map, provider scale, and a conservative projection ($0.50/txn revenue).	DONE
Backend README + CU spec	Deploy guide + exact credit-union requirements (ODFI, Same-Day ACH, Company ID, settlement, return handling).	DONE

5 Current capabilities & what's pending for production

Working now

- **Digital onboarding flow** end to end (member journey).
- **Native bank linking** across 4,100+ U.S. institutions (real directory + ABA).
- **Automatic address population** (real).
- **Native ownership verification** — real deployed backend (sandbox), attempt-limited.
- **Core operations console** (tracking, reconciliation, fraud, reporting).
- **Secure, installable PWA** at payvyn.org (HTTPS).

Pending for real money movement

- **Identity / KYC** — simulated; connect the CU's CIP or a provider. PENDING
- **ACH / FedNow movement** — simulated; needs the CU's ACH origination (ODFI). PENDING
- **Verification → production** — flip `ACH_MODE=production` + the CU's ACH config. PENDING
- **Core integration** — console is local; wire the core connector for crediting/reconciliation. PENDING
- **Shared backend for onboarding/ops** — move from browser storage to a secure DB. PENDING

Readiness: the member-facing layer and the ownership-verification backend are built and deployed. Going live for real money movement is a configuration-and-integration effort with the credit union (ACH origination + core), not a ground-up build.

6 Capacity & scale

Component	Runs on	Daily capacity (now)	At scale
Bank linking + ABA + directory	Browser (client-side)	Effectively unlimited	Unlimited
Address autofill	OpenStreetMap (free)	~1/sec → a few thousand/day	Self-host / geocoder for heavy use
Ownership verification	Cloudflare Worker + KV	**~500 verifications/day** (KV free: 1,000 writes/day)	**~500,000/day** on the $5/mo plan
Onboarding / Core Console	Browser (localStorage)	Unlimited (per device)	Move to DB for shared data
Site hosting	GitHub Pages	~100 GB/mo bandwidth	Ample for tens of thousands/day

Headroom: the only real ceiling today is the verification backend at **~500/day** (free tier). A **$5/month** Cloudflare Workers plan raises it to **~500,000/day** — beyond any realistic credit-union volume — with no code change.
